due: Oct 9, 2019 at the end of discussion

```
library(tidyverse)
library(fivethirtyeight)
library(titanic)
```

Slide 9 Plot

Text:

1. Survived
2. Survived is on the x-axis
3. Bar plot

Code:

```
titanic_train %>%
  ggplot(aes(x = Survived)) +
  geom_bar()
```

Slide 10 Plot

Text:

1. Fare
2. Fare is on the x-axis
3. Histogram

Code:

```
titanic_train %>%
```

```
  ggplot(aes(x=Fare)) +  
  geom_histogram()
```

```
## `stat_bin()` using `bins = 30`. Pick better value with `binwidth`.
```

Slide 11 plot

Code:

```
titanic_train %>%  
  ggplot(aes(x=Fare)) +  
  geom_histogram(bins = 40)
```

Slide 13 plot

Text:

1. Pclass and Fare
2. Pclass on x-axis, Fare on y-axis
3. Boxplot

```
titanic_train %>%  
  ggplot(aes(x=factor(Pclass), y= Fare)) +  
  geom_boxplot()
```

Slide 15 plot

Text:

1. Age and Fare
2. Age is on x-axis and Fare is on y-axis
- 3.

```
titanic_train %>%  
  ggplot(aes(x=Age, y= Fare)) +  
  geom_point()
```

```
## Warning: Removed 177 rows containing missing values (geom_point).
```

No real relationship between Age and Fare

Slide 21 plot

Code:

```
titanic_train %>%  
  ggplot(aes(x=factor(Pclass), fill=Survived)) +  
  geom_bar(aes(fill=factor(Survived)))
```

Slide 22 plot

Code:

```
bechdel %>%  
  ggplot(aes(x=domgross, fill = binary))+  
  geom_histogram(aes(fill=binary),bins = 80) +  
  scale_fill_manual(values = c("blue", "magenta"))
```

Warning: Removed 17 rows containing non-finite values (stat_bin).
